In vector space retrieval each row of the matrix M corresponds to

- A. A document
- B. A concept
- C. A query
- D. A term

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 1

Answer D

M is an mxn matrix, with m rows corresponding to the m terms in the vocabulary.

Applying SVD to a term-document matrix M. Each concept is represented in K

- A. as a singular value
- B. as a linear combination of terms of the vocabulary
- C. as a linear combination of documents in the document collection
- D. as a least squares approximation of the matrix M

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 2

Answer B

K is mxr matrix, where the columns correspond to vectors. These vectors correspond to a linear combination of the m terms of the vocabulary.

The number of term vectors in the matrix \mathbf{K}_{s} used for LSI

- A. Is smaller than the number of rows in the matrix M
- B. Is the same as the number of rows in the matrix M
- C. Is larger than the number of rows in the matrix M

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 3

Answer B

K_s is a mxs matrix, where each row corresponds to a term in the vocabulary, as for M. The number of columns s is smaller than the number of columns in the original matrix K.

A query transformed into the concept space for LSI has ...

- A. s components (number of singular values)
- B. m components (size of vocabulary)
- C. n components (number of documents)

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 4

Answer A

The transformed query is a vector over the number of selected concepts s.

A row of matrix $W^{(c)}$ represents

- 1. How relevant each word is for a dimension
- 2. How often a context word c co-occurs with all words
- 3. A representation of word c in concept space

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 5

Answer 1

The rows of the matrix correspond to the dimensions of the embedding. Each entry in the row corresponds to a word from the vocabulary. Therefore the row represents the importance of each word for a given dimension.

Which of the following functions is not equal to the three others?

- 1. f(w, c)
- 2. $f_{\theta}(w,c)$ 3. f(w,c)4. $\sigma(c \cdot w)$

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 6

Answer 1

f(w,c) is the function to be approximated. The three other functions are the same, with a more detailed specification for answers 2, 3 and 4.

From which data samples the embeddings are learnt?

- 1. Known embeddings for (w,c) pairs
- 2. Frequency of occurrences of (w,c) pairs in the document collection
- Approximate probabilities of occurrences of (w,c) pairs
- 4. Presence or absence of (w,c) pairs in the document collection

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 7

Answer 4

In the skipgram model the sample data consists of word-context pairs that are present or absent in the document collection.

With negative sampling a set of negative samples is created for

- 1. For each word of the vocabulary
- 2. For each word-context pair
- 3. For each occurrence of a word in the text
- 4. For each occurrence of a word-context pair in the text

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 8

Answer 4

For each occurrence of a word-context pair, a set of negative samples is produced. Note that this is also different from creating a set of negative samples for each word-context pair, since the same word-context pair can occur multiple times in the document collection.

The loss function is minimized

- 1. By modifying the word embedding vectors
- 2. By changing the sampling strategy for negative samples
- 3. By carefully choosing the positive samples
- 4. By sampling non-frequent word-context pairs more frequently

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 9

Answer 1

The loss function is minimized by incrementally modifying the word embedding vectors. Answer 4 refers to an approach to improve the quality of the word embeddings achieved, but not to minimize the loss function.

A word embedding for given corpus ...

- 1. depends only on the dimension d
- 2. depends on the dimension d and number of iterations in gradient descent
- 3. depends on the dimension d, number of iterations and chosen negative samples
- 4. there are further factors on which it depends

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 10

Answer 4

Other factors that can influence the outcome of the optimization are

- The order in which the documents are processed
- The initialization of the word embedding vectors

Fasttext speeds up learning by

- 1. Considering subwords of words
- 2. By selecting the most frequent phrases in the text as tokens
- 3. By selecting the most frequent subwords in the text as tokens
- 4. By pre-computing frequencies of n-grams

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 11

Answer 3

Answer 1 improves the quality of embeddings, but may slow down learning. Answer 4 speeds up the selection of frequent phrases, but not learning.

The most important difference between Glove and skipgram is

- That Glove considers the complete context of a word
- That Glove computes a global frequency for wordcontext pair occurrences
- 3. That Glove uses a squared error loss function
- 4. That Glove does not differentiate words and context words

©2024, Karl Aberer, EPFL-IC, Laboratoire de systèmes d'informations répartis

Introduction - 12

Answer 2

The main difference between Glove and earlier methods, including skipgram and CBOW, is the computation of global co-occurrence counts. This is an additional processing step, but provides additional information on the global statistics. Answer 3 refers to a difference that is rather a consequence of using a global statistics. As for answer 4, in a sense also skipgram does not really distinguish between words and context words.
